

randomUuid

Description

Returns a randomly generated UUIDv4, useful for assigning identifiers to documents.

Syntax

```
randomUuid(): string
```

Example

Use case: Add unique identifiers to documents

Suppose you have log documents that do not include a `request_id`. You can generate one automatically. Consider this document:

```
{
  "path": "/home",
  "domain": "coralogix.com",
  "full_url_encoded": "aHR0cHM6Ly9jb3JhbG9naXguY29tL2hvbWU="
}
```

You can assign a new UUID with:

Example query

```
create request_id from randomUuid()
```

Example output

```
{
  "path": "/home",
  "domain": "coralogix.com",
  "full_url_encoded": "aHR0cHM6Ly9jb3JhbG9naXguY29tL2hvbWU=",
  "request_id": "37367559-35f4-459c-943e-19025765da15"
}
```
