Coralogix
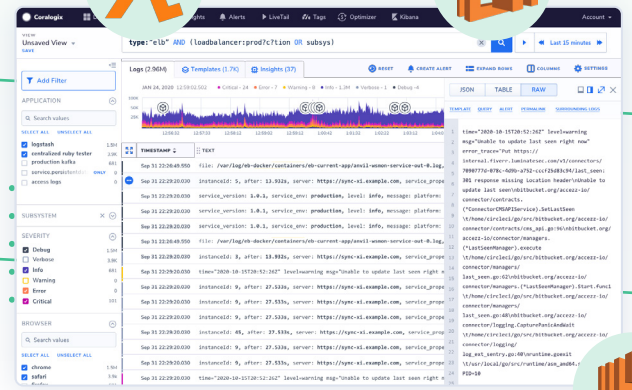

Full Visibility and Insights for Cloud Applications in AWS

As organizations migrate to the cloud, they relinquish direct access to their servers and associated data such as logs and metrics. The ability to access this data is fundamental to observability.

Amazon has worked to compensate for this undesirable side effect by creating a wide variety of AWS services which provide the user access to different parts of their cloud data. Unfortunately, the disparate nature of these services only creates another problem. How do you bring it all together?

Centralized Data Collection

With Coralogix, you can ingest data from any source for a single, centralized platform to manage, monitor, and alert on your applications. As log and metric data are ingested, Coralogix instantly narrows down millions of data entries to just hundreds of common patterns for deeper insights and faster troubleshooting.

Machine learning algorithms continuously observe your log patterns and flows between system components and automatically notifies you when a pattern deviates from the norm – without static thresholds or the need for pre-configurations.

"Now, we can see the full picture from the applications to the logging systems without having to manage any of the complexity."

Ben Yitzhaki | Infrastructure Engineer at Monday.com

3-Click AWS Security

The Coralogix Cloud Security solution enables organizations to quickly improve their security posture, detect threats, and continuously analyze digital forensics without the complexity, long implementation cycles, and high costs of other solutions.

With the Coralogix Optimizer, you can reduce up to 70% of storage costs without sacrificing full security coverage and real-time monitoring. This new model enables you to get all of the benefits of an ML-powered logging solution at only a third of the cost and with more real-time analysis and alerting capabilities than before.

AWS Advanced Technology Partner

As an AWS Advanced Technology partner, we are one of only a small number of AWS logging certified companies offering the most advanced capabilities for logging, metrics, and security insights.

Cost Optimization Powered by Streama

Priority-based ingestion strategies powered by Streama technology allow for full observability by analyzing your data before it's stored which helps reduce costs and improve system visibility. This means you pay relative to the value of your data rather than volume, enabling up to 70% savings on storage and licensing costs.

We have direct integrations for all major AWS technologies, including certified Lambda Extensions.
