

# Your Data. One Platform. Endless Possibilities.

With business data outpacing the growth of revenue, Coralogix's next-generation Streama© architecture is built — and priced — to ensure that all of your data is leveraged to inform every part of your product, operations, and business.

## Infinite Insights With Predictable Costs

Streama©, the streaming analytics pipeline that powers our platform, analyzes data in real-time and provides stateful insights without relying on indexing or any centralized datastore.

Components within the stream that store the system state are used to produce long-term trend analysis,

dynamic alerting, anomaly detection, and more — all with no index latency or mapping dependency.

Upon parsing and enrichment, data is stored in a client-side archive bucket with the ability to directly query remote storage from the Coralogix UI or CLI giving users infinite retention.

### Logs

Aggregate noisy log data into templates and metrics on-the-fly for long-term monitoring

### Metrics

Build custom data maps for any metric to access endless visualizations of your system health

### Tracing

Collect tracing data to monitor event flows and bottlenecks across distributed systems

### Security

Fully secure your cloud-native environments to the highest standards within minutes

## Your Partner in Observability

Our dedicated customer success team is available 24/7 via in-app chat to help with everything from data processing and querying to visualizations and alerting to ensure you get the most out of the platform.

-  Under 30s Median Response Time
-  No Bots – Only Real, Talented Engineers!
-  Full On-Boarding & Integration Support

“Unlike most tools in the market, the platform is very intuitive and requires very little training to use which has led to widespread adoption across our entire engineering department.”

**Roi Amitay** - Head of DevOps

# Powered by Streama®

Our next-generation Streama® architecture is built — and priced — to help you extract infinite insights and make sense of ever-growing data as you scale.

- Better Performance
- Highly Scalable
- Optimized Costs

## Advanced TCO Optimization & Direct Archive Query

Leverage the proactive analytics of Streama® to route data to three different pipelines according to use case for advanced cost optimization. Data that is frequently searched can be selectively indexed for lightening-fast queries, while the rest can be monitored for infinite insights and archived for compliance without ever being indexed.

All alerting, metric generation, and data clustering features can be leveraged on monitoring data for full coverage without any tradeoffs. Data written to your remote storage can be queried directly from the Coralogix platform at any time with no effect on daily quota or added compute costs.
